Advanced SQL and Cloud

# Install PostgreSQL and pgAdmin

**Important:** If you already have postgres and pgAdmin installed, skip this slide. There is no need to reinstall, and it can make it more confusing if you have multiple installations.

- Download and install the latest version of PostgreSQL for your OS:  
<https://www.enterprisedb.com/downloads/postgres-postgresql-downloads>
  - For Mac and Windows 64-bit, this will be Version 18.0
  - Linux users will need to use the following link: <https://www.postgresql.org/download/>. You will also need to install pgAdmin. Installation instructions can be found here: <https://www.pgadmin.org/download/>.
- During installation you can accept all the defaults **except** you can uncheck **Stack Builder** on the **Select Components** menu
- When asked for a database password, use **postgres**
- Confirm the port number is **5432**

Very important to  
use this password!

*Note: Since this is not secure data, we can set our passwords to **postgres**. This is not something you would do with secure data in a production environment*

# Launch pgAdmin

- Either search for **pgAdmin** in the search bar or navigate to it in your file browser
- Once launched, it will prompt you for a password, which you should have set to **postgres** during the install.

Unlock Saved Passwords

Please enter your master password.

This is required to unlock saved passwords and reconnect to the database server(s).

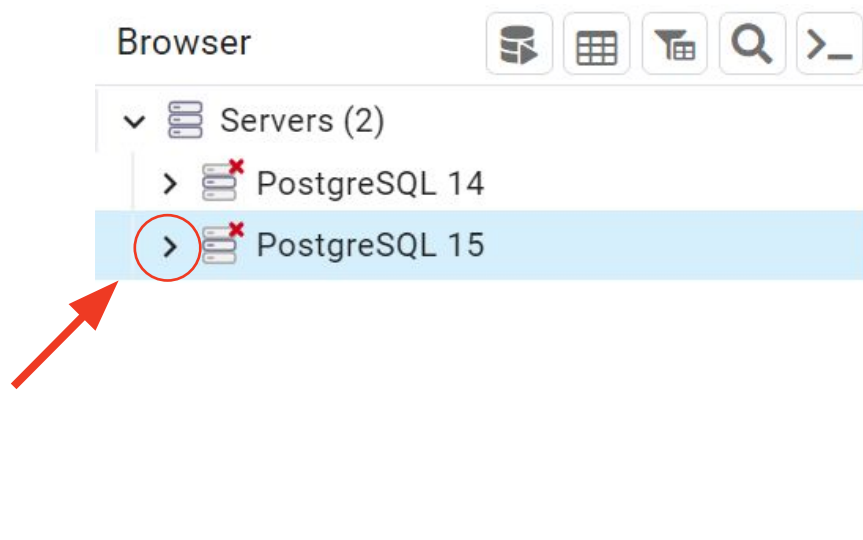

Reset Master Password

✕ Cancel

✓ OK

# Access Server

- Click the arrow next to **PostgreSQL 16** in the left hand menu

# Access Server

- You will be prompted to enter a password for the server, which is also **postgres**
- Check the **Save Password** box so you won't be asked for a password at this stage again
- Click **OK**

Connect to Server

×

Please enter the password for the user 'postgres' to connect the server - "PostgreSQL 15"

.....

☒ Save Password

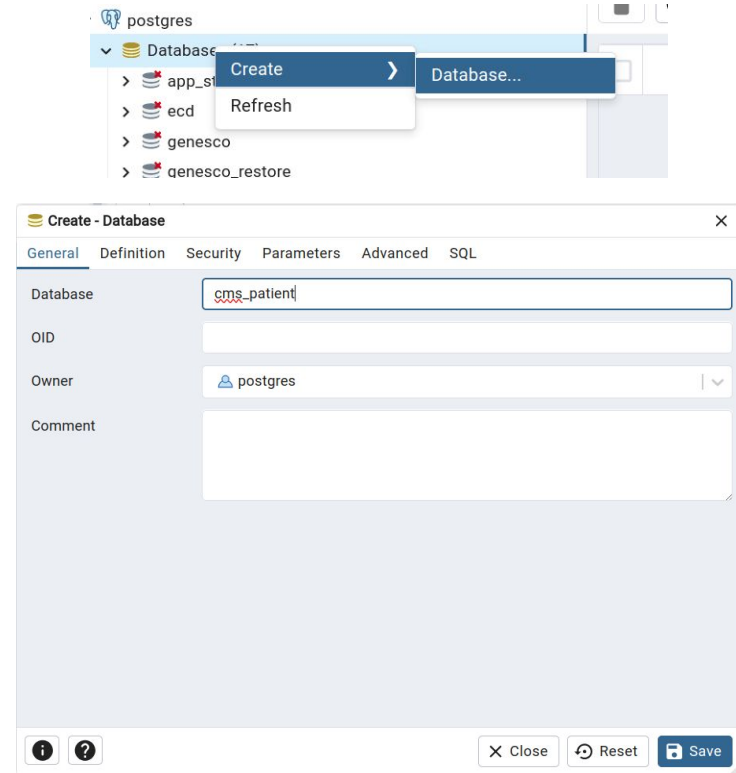

×

 Cancel

✓ OK

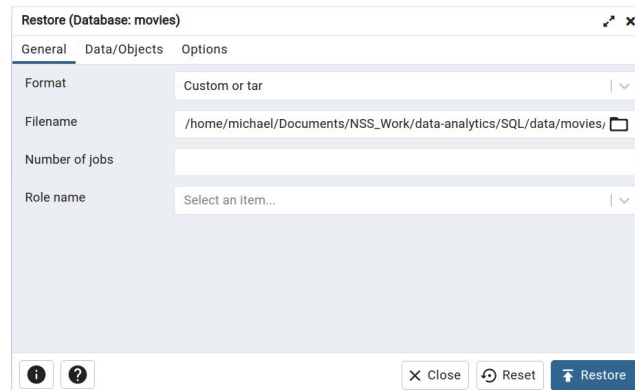

# Restoring from a Backup

- Download the cms\_patient backup file from [here](#).
- Right-click on Databases and select Create > Database...
- In the dialog box that pops up, fill in the Database name: cms\_patient
- Click Save in the bottom right.

# Restoring from a Backup

- Right-click on the newly-created database and select “Restore...”
- Set the Format to “Custom or tar” and then click the folder icon and navigate to wherever you saved the backup file.
- Finally, click “Restore”.

Restore (Database: movies)

General Data/Objects Options

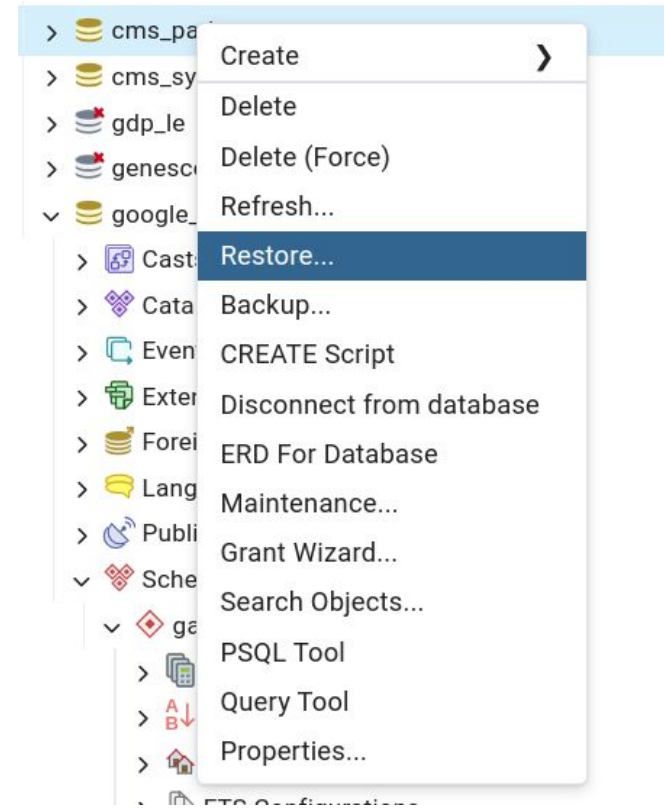

Format: Custom or tar

Filename: /home/michael/Documents/NSS\_Work/data-analytics/SQL/data/movies/

Number of jobs:

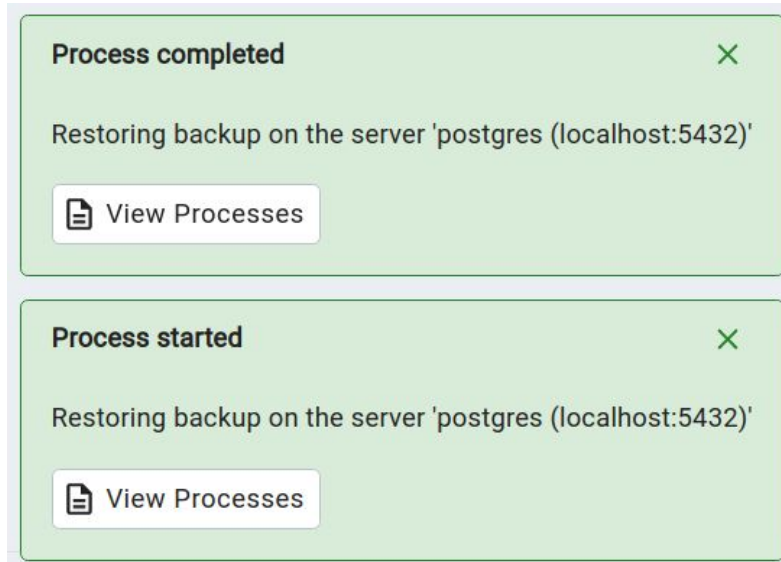

Role name: Select an item...

Close Reset Restore

# Success!

- Your database should be restored and you should get a similar success message.

# Confirm the Restore

Open the query tool in your newly-restored database and run

```
SELECT COUNT(*)  
FROM person;
```

This should show that there are 100,000 rows.
